Comments to Evaluators:

I am thrilled to finally be using javascript and Jquery(ajax). I am very well-versed in Javascript and Jquery and I understand how it works very well so I didn't need any resources on how to do it.

I decided to use bootstraps switches on the user permissions view so it would look nice. It all works great.
I used the sweet alerts on all of the ajax requests so that you can be updated if the request is successful or not.

I did not add spinners just due to time constraints. (I should have started earlier).

I also chose to work alone which made the timing difficult. Debugging some jquery or ajax calls took some time but I got it figured out.

Important – the database may need to be updated before signing in will work or seeded data will appear. Enter the following commands exactly in NuGet Package Console:

Drop-Database -Context LOContext

Drop-Database -Context UserRolesDB

Update-Database -Context LOContext

Update-Database -Context UserRolesDB
